recently many sla researchers have adopted a postmodernist approach which challenges the assumption that sla research is a rationalist scientific endeavour the resulting epistemological

arguments plus problems of theory proliferation contradicting theories and theory domain hinder progress towards a unified theory of science. This book addresses these problems by returning to first principles. It asks whether there is such a thing as reliable knowledge, what is special about scientific method, and how we can best explain science. It is the first book to use the philosophy of science in order to examine the epistemological underpinnings of science research and evaluate rival theories of science. Part one explores the central issues in the philosophy of science, defends rationality against relativists, and offers guidelines for theory assessment. Part two examines different theories of science and evaluates them in terms of how well they stand up to the guidelines.

This special issue features papers that offer deeply felt, valuable perspectives on diverse aspects of theory construction in social psychology. The goal is to furnish a basis for starting a discussion about the considerable challenges of theorizing, the ways of meeting those challenges, and the great rewards that successful theorizing offers to the discipline as a whole.

A primer in theory construction is for those who have already studied one or more of the social, behavioral, or natural sciences but have no formal introduction to the way theories are constructed, stated, tested, and connected together to form a scientific body of knowledge. The author discusses scientific theories in general terms but also addresses the special challenges of developing scientific knowledge about social and human phenomena. This Allyn and Bacon Classics Edition contains the complete text of the original copyright 1971 version with new typography and page design.

The book opens with a discussion of the philosophical foundations of theorising in the social sciences, goes on to describe the components of theory, and then compares deduction and induction as tools of research and theory construction, with particular emphasis on conceptualisation, the identification of properties and dimensions, constructing theoretical statements, linking properties and dimensions, as well as developing and integrating categories. In deduction and induction respectively, the writer of the book has made a bold attempt to produce an overview of the needful for the production of quality academic research reports, beginning with a discussion on theories and theory building methodology, and data analysis attempts are also made to demonstrate the link between theory, theorising, on one hand, and on the other, methodology, analysis of data, and production of quality research reports. The book undeniably fills the gap needed at this point, helping teachers, students of sociology and other social science.

theory matters in applied disciplines fields that apply scholarly research to professional practice such as management social work health care human resource development education and many others because these disciplines deal with human beings in the real world a flawed theory can result in actual harm to people and institutions when faced with a professional problem practitioners resort to the latest fad or simply throw everything and anything at it because of the lack of sound theory scholars deal with problems by slicing them into small segments to study them but fail to address the practical implications what s needed is a way to unite research and practice to create robust theory this is exactly what richard swanson and thomas chermack offer here a complete five step method for developing sound field tested theory in applied disciplines unlike many existing methods which cover only the initial conceptualization of a theory the authors offer a complete approach from conceptualizing a theory to creating relevant assessment criteria establishing a research agenda to test the theory s validity applying the theoretical concepts in the real world and using that experience to further refine and improve the theory the method is not restricted to any single discipline nor is it beholden to any research ideology swanson and chermack provide a set of tools for each phase of the process making this book accessible and applicable to a wide audience and in addition to examples in each chapter they offer two extended case examples of complete theory building with flawed theories impeding the development of many applied disciplines this book is desperately needed

to make a contribution we need to identify scholarly holes this booklet provides recommendations to identify papers and to take advantage of reference and database software to both identify key authors and papers and to elicit ideas for the purpose of theory construction it also presents a coding mechanism for the review of the literature to subsequently construct a visual map using open source software which can more easily help us to identify holes in current research the codes will help to determine the main disciplines and sub disciplines the methods most commonly used the levels of analysis as well as the types of studies that others have used to approach the subject under research
